The Future of Smarter and Safer Indoor Air

Loughborough College Case Study

Case Study - Loughborough College

Purchased 20 units in July 2021

For more than 100 years, Loughborough College has been providing high quality education and training. We place students at the heart of everything that we do. What sets us apart is our commitment to the wellbeing and safety of our whole community. We create an environment of learning and creativity, allowing our students to flourish and achieve their aspirations.

Inclusion is central to our ethos and we welcome a diverse student population from all over the world, every year, to our friendly campus.

As part of our commitment to safety, we undertook ventilation assessments of our entire campus as part of the increasing awareness of indoor air quality and the airborne risk of COVID-19.

Whilst we were conducting these assessments, MedicAir contacted us to explain how they could assist with any issues we encountered.

Once the assessments were finished, we concluded that we had a small number of spaces where MedicAir could help in providing cleaner, safer air for our students and staff.

The process to procure the MedicAir air purifiers was simple with a knowledgeable and experienced product specialist available to answer any queries and provide us with dedicated service. Our units arrived quickly and were easy to install, we simply took them out of the box, plugged them in and turned them on.

“MedicAir were able to provide us with a sophisticated piece of equipment encompassing trialled and tested air purification technology. Their independent laboratory testing gave us confidence that the air purifier could do what was claimed and the high Clean Air Delivery Rate (CADR) of the unit meant that we required fewer of these devices than others that are available.

Our product specialist was on hand every step of the way and order and delivery was quick and convenient.”
